The aarA gene encodes the citrate synthase and is part of an acetic acid resistance operon comprising aarA, aarB and aarC.

The DNA can be used to prepare an acetic acid resistant strain of bacteria for use in acetic acid fermentation.

Con homology with an E. coli protein, is a methyl tetrahydropteroyltri glubarder-homocysteine methyltransferase, and is encoded by a DNA of the glubarder-homocysteine methyltransferase, and is encoded by a DNA of the invention. The DNA sequences were isolated from S. pneumoniae strain invention. The DNA sequences were isolated from S. pneumoniae strain 0100993 (NCIMB 40794). The Streptococus pneumoniae proteins of the invention can be used to identify compounds which interact with and inhibit or activate the activity of the proteins. Antagonists can be used to treat diseases caused by S. pneumoniae proteins, through genetic immunisation. They can also be used to induce an immunological response in a mammal by inoculation with the S. pneumoniae proteins of delivery of the encoding nucleic acids in a vector adequate to produce antibody and/or I cell immune responses to protect the animal from disease. The proteins can also be used to identify antimicrobial compounds which are capable of inhibiting their bloactivity. In particular the proteins of the invention can be used to prevent adhesion of bacteria to mammalian compounds. The proteins of proteins and produce antibody antimicrobial compounds which are capable of inhibiting their bloactivity. In particular the proteins of progression of pathogenesis in infections initiated other than by the compounds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps 10;

Mriobacter pylori nucleic acid sequences and encoded polypeptide(s) - useful in vaccines to treat or prevent H. pylori infection and for diagnosis of H. pylori infection or to identify H. pylori polypeptide binding compounds, useful as potential H. pylori life cycle activators or inhibitors. The DNA and probes derived from it may be used for the identification of H. pylori in a sample and the diagnosis of H. pylori infection. Nucleic acid sequences complementary to the DNA act as antisense sequences and used to prevent the translation of H. pylori mRNA. Antibodies against the protein can be used in immunoassays to evaluate the abundance and distribution of H. pylori specific antigens. The genomic sequence of H. pylori (ATCC 55679) was determined from overlapping contigs generated by mechanically shearing the bacterial DNA. The sequences were analysed for ORF of at least 180 nucleotides, and the predicted coding regions defined by computer evaluation. To identify likely H. pylori antigens for vaccine development, the amino acid sequences predicted from various ORF
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    9
                                                                                      DNA, vectors, transformed cells and antibodies, for diagnosis and treatment of neurological disorders, e.g. Parkinson disease Example 2: page 114-115; 181pp; English.

The CDNA encoding the chromaffin granule amine transporter protein is useful in gene therapy and as a probe for detecting genomic sequences. The protein is used for screening cytoroxic compounds implicated in Parkinsons disease, diseases associated with activity of neurotoxins or psychiatric disorders and to identify compounds which selectively inhibit or activate its action. Antibodies raised against this protein are useful as immunoassay reagents for detecting the protein and as affinity reagents for purification. This fragment of the transporter protein shares homology with the Neternial domains of the methlenomycin; tetracycline and multi-drug

Claim 1: Page 20-21; 26pp; Japanese.
This sequence is a rat CC chemokine receptor. The receptor can be used to screen for novel binding compounds and for preparation of antibodies or antiserum.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              379 LFQL-VAKLYEVF-LQFLQNLAKL-NPWPNVDAHSGVLLN-YY-GLTEARYYTVLFGVSR 433

This is the amino acid sequence of the mouse laminin A chain. The primary object of the invention is to use laminin, laminin-derived protein fragments and/or laminin-derived polypeptides as potent inhibitors of amyloid formation, deposition, accumulation and/or persistence in Alzheimer's disease and other amyloidoses. The laminin products (see W50888-98) may include mouse or human laminin A or Al chain, laminin Bl or B2 chain, laminin A2 chain (merosin), laminin G1 chain, the globular repeats of the laminin A1 chain and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Wouse laminin A chain.

the beta-amyloid binding domain of the laminin A chain. A claimed method for treating an amyloid disease comprises administering a polypeptide having a conformational similarity to a fragment of a laminin protein. A method for diagnosing an amyloid disease laminin protein. A method for diagnosing an amyloid disease in hoolves determining levels of laminin in a sample. Production of laminin or its fourth globular repeat in vivo provides a method for in vivo inhibition of beta-amyloid amyloidosis. The products
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         N-PSDB; 062695.
New C-C chemokine receptor and nucleic acid - are used to develop
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         prods. for use in diagnosis and therapy of inflammation and other cytokine-mediated disorders
                                                                                                                                                       and methods can be used for the diagnosis, prognosis, monitoring and treatment of amyloidoses such as Alzheimer's disease, Down's syndrome and hereditary cerebral haemorrhage with amyloidosis of the Dutch type (where the specific amyloid is the beta-amyloid protein), the amyloidosis associated with chronic inflammation, various forms of malignancy and Familial Mediterranean Fever (AA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              (prealbumin or transthyretin amyloid), and the amyloidosis associated with endocrine tumours such as medullary carcinoma of the thyroid (variant of procalcitonin).
                                                                                                                                                                                                                                                                                                                                                                                                                                                      (beta 2-microglobulin amyloid), the amyloidosis associated with senile cardiac amyloid and Familial Amyloidotic Polyneuropathy

This sequence represents human MIP-1 alpha/RANTES receptor (macrophage inflammatory protein 1 alpha/regulated on activation, normal T cell expressed and secreted). The human MIP-1 alpha/RANTES receptor protein may be used in a method for the screening of human MIP-1 alpha/RANTES receptor receptor affinity compounds. The MIP-1 alpha/RANTES receptor coding sequence may be included in an expression vector, preferably pCCR, and used to transform a CHO cell for use in the same method. The receptor protein can provide a preventive and treating agent for viral diseases, infectious diseases, tumours, allergy, diabetes, central diseases, hyperlipidaemia, hypercholesterolaemia, osteoporosis, digestive ulcers,
                                                                                                                   20-NOV-1997 (first entry)
Human MIP-lalpha/RANTES receptor protein.
Human MIP-1 alpha/RANTES receptor; osteoporosis; pcCR; digestive ulcer;

            This polypeptide comprises a claimed receptor for human macrophage inflammatory protein-1 alpha (MIP-1 alpha) and regulated upon activation normal T expressed and secreted (RANTES) protein. Also claimed are: a nucleic acid (see T90384) that encodes the receptor: a subsequence of the nucleic acid, having at least 12 contiguous nucleotides: a cell transformed or transfected with the nucleic acid; and purified MIP-1 alpha/RANTES receptor polypeptide. The products can be used for detecting the MIP-1 alpha/RANTES receptor and polymorphisms in physiological samples. In addition, the receptor can be expressed and used to assay for MIP-1a/RANTES in useful for monitoring the levels of these cytckines in a patient. Such measurements are useful in following the antiinflammatory effects of drugs and prospective usefulness of new antiinflammatory

prodn. of polypeptide(s) for stimulating immune system against HRV
                                                               The viral proteins are used for stimulating a protective immune response and for blocking cellular receptors. Abs against them are useful for assay and purificn. of the corresp. antigen, and can also be used for the therapeutic and diagnostic applications. Sequence 2164 AA;

citrate (si) synthase (EC 4.1.3.7) precursor, mitochondrial - Arabidopsis thallana
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      *#cross-references EMBL:X17528; NID:g11243; PID:e1188578; FID:g2652924
*#note the sequence from Fig. 2 is inconsistent with that from
Fig. 1 in having 47-G1y, 125-Trp, 14-Leu, 151.Ser,
185-Asn, 187-Asn, 191-Asn, 348-Leu, an additional G1y
after 89-Trp, an additional Val after 393-Cys and two
additional Arg after 228-Arg, in lacking 114-Leu and
residues 333 to 241
                                                                                                                                                                                                                                                                                                                                                                                                                                               Plant Mol. Biol. (1989) 13:411-418
Isolation of a cDNA encoding mitochondrial citrate synthase
from Arabidopsis thaliana.
                                                                                                                                                                                                                                                                                                                                                                                                                 Unger, E.A.; Hand, J.M.; Cashmore, A.R.; Vasconcelos, A.C.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      61 SEHGKVQLGNITVDMVIGGMRGMTGLLWETSLLDPEEVFALGDCRLPECQKALLPTAQSG 120

#title Isolation, nucleotide sequence, and expression of a cDNA encoding pig citrate synthase.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      It is synthesized in the cytoplasm but functions in the mitochondrion of eukaryote cells. This molecule is a dimer of identical chains. Each dimer binds two molecules of acetyl-CoA and two molecules of oxaloacetate at two active sites.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ts annotation; X-ray crystallography, 2.7 and 1.7 angstroms citrate (si)-synthase is found in nearly all cells capable of oxidative metabolism. It catallyzes the condensation of oxaloacetate and acetyl-CoA to form citrate in the tricarboxylic
                                                                                                                              citrate (si)-synthase (EC 4.1.3.7) precursor - pig

                                                                                                                                                                                                                                                                                                                                                                                                                    Takeda, T.; Watanabe, Y.; Numata, O.
Biochem. Biophys. Res. Commun. (1997) 237:205-210
Direct demonstration of the bifunctional property of
Tetrahymena 14-nm filament protein/citrate synthase
following expression of the gene in Escherichia coli
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   #molecular-weight 52575 #checksum 9423
